Nonlinear Dynamics in Computer Graphics: Reaction–Diffusion Systems in Procedural Generation

Ragav Srinivasan

October 29, 2026

Abstract

[TODO: Abstract goes here.]

1 Introduction

[TODO: Hook: where do textures in games/films come from? Hand-painted vs. procedural.]

[TODO: Introduce the idea that simple chemical rules can produce animal-coat patterns (Turing 1952), and that this was brought into graphics in 1991 (Turk 1991; Witkin and Kass 1991).]

[TODO: State the aim of this report in one or two sentences, and give a roadmap: Section 2 covers …, Section 3 …, Section 4 …]

The aim of this project is to study about Reaction Diffusion Systems, explore it's applications and apply it to some real world problem.
This paper is structured as follows 1) A background on Reaction Diffusion Systems 2) Introducing the focus of this project 3) My original contribution and 4) Results and conclusions of this study.

2 Background

2.1 Reaction Diffusion Systems

[TODO: General form, then the specific model you choose.]

A two-species reaction–diffusion system has the form

$$\frac{\partial u}{\partial t} = f(u,v) + D_u \nabla^2 u, \qquad \frac{\partial v}{\partial t} = g(u,v) + D_v \nabla^2 v, \tag{2.1}$$

where f and g describe the local chemistry and the ∇^2 terms describe diffusion.

3 Undecided

[TODO: Todo 1]

[TODO: Todo 2]

[TODO: Todo 3]

4 Undecided

[TODO: Todo 1]
[TODO: Todo 2]
[TODO: Todo 3]

5 Conclusions

[TODO: Write conclusion]

[TODO: Further directions: e.g. textures on curved surfaces (Turk 1991), GPU/real-time implementation, other models.]
